

TSAPS High-Definition Circumferential Lipoabdominoplasty Dr. Yen-Chou Chen 陳彥州

Abdominoplasty is a common surgical procedure, but postpartum patients often have issues with excess fat, so they often require simultaneous liposuction to achieve slimmer waist line and tighter skin. Performing both procedures simultaneously may increase complications, so many surgeons propose different surgical approaches. In this presentation, the speaker will propose how to use the TSAPS abdominoplasty concept along with simultaneous 360-degree circumferential high-definition liposuction.

TSAPS abdominoplasty refers

1. **T**umescent dissection in **S**upraareolar plane
2. **A**void drain 3. **S**ubcostal **P**erforator sparing
4. deep fat **S**culpting.

This technique not only achieves excellent surgical results but also minimizes the occurrence of complications to the greatest extent possible.
